

HUMANISING TECHNOLOGY FOR THE MASSES HAS NEVER BEEN MORE IMPORTANT

New device lets wearers sense the location and heartbeat of their loved ones

London: CyborgNest released the beta test reviews of their latest new-age wearable device SenTero, and the community are hooked. The proof of concept works! SenTero is a sensory enhancement device which allows people to feel their loved ones and meaningful places through patterned vibrations on their skin. In addition, the ability to sense north orients and connects people on a global scale. The innovative device teaches the brain through neuroplasticity to non-invasively input these new location data streams, and through the personalisation of the data has the potential to create a myriad of untapped, unique-to-wearer, human enhancement possibilities.

“CyborgNest is here to humanise tech in the real and digital worlds - adding to social media, the metaverse and gaming an emotional connectivity level that is usually not associated with technology. New senses will create a new bridge of understanding between all people.” - says Liviu Babitz, Co-Founder at CyborgNest

“It is not just a notification on a screen, over time with continued use will change your perceptions so that you can experience the world in new and unimaginable ways.”

Features and benefits of SenTero include:

- Without needing to look at a screen wearers can sense the direction and heartbeats of loved ones.
- SenTero delivers patterned vibration data streams which are a unique form of communication through the skin.
- By focusing on enhancing humans and not machines CyborgNest has developed a world first wearable device that is dedicated to humanizing technology - supporting humanity's social, emotional and physical

wellness through the predominantly uncharted territories of sensory enhancement tech.

Pre-orders for the SenTero are available now at an early adopters' rate of \$249. For more information on SenTero and to view their beta test reviews visit
